

CKFinder is composed of two parts: the client-side part and the server-side connector(s).

The client-side part is written in JavaScript and is common across all distributions (PHP and ASP.NET), while the server-side parts are different for each language. There are thus multiple CKFinder 3 documentation websites available.

[CKFinder 3 Documentation](#)

This website contains documentation for the JavaScript, client-side part of CKFinder which is common for all versions of CKFinder 3. It includes information about:

- Integrating CKFinder with your website or with CKEditor.
- Client-side configuration options.
- API documentation.
- Tutorials about creating JavaScript plugins.
- Tutorials about creating skins.
